

Ecological cleaning product "by Iris"

“Liquid Molecular Fragmenter” AKKA20 LMF®: a revolutionary formula

which constitutes the basic component of a series of products specially designed for interventions in the environmental and industrial sector.

A real technological innovation: ecological, biodegradable, respectful of the delicate ecosystem balances, highly efficient and easy to use, guaranteeing rapid results

Our product allows you to perform industrial washdowns more efficiently in less time.

How it works ?

It is a bio-surfactant that has the ability to fragment hydrocarbon chains, making them stable over time and preventing the reaggregation of the molecules themselves.

A rapid and impact-free natural biodegradation mechanism.

It is a high-performance formulation, whose action spectrum is not subject to the influence of low and high temperatures (up to 160°) or other physico-chemical parameters.

Product Features

- ❖ A water-based formulation (98%) with the presence of sodium metasilicate and a supramolecular aggregation of surfactants which allows the degradation of hydrocarbons in soils and waters
- ❖ Totally biodegradable (> 90%)
- ❖ It is not flammable
- ❖ It does not develop fumes and odors
- ❖ No risk to handle
- ❖ It is suitable for cleaning ships and boats in port environments. Seawater can be used for any wash... with a lasting positive effect on the maritime environment if the wash water is thrown overboard.
